

OUR BEST SHOT:

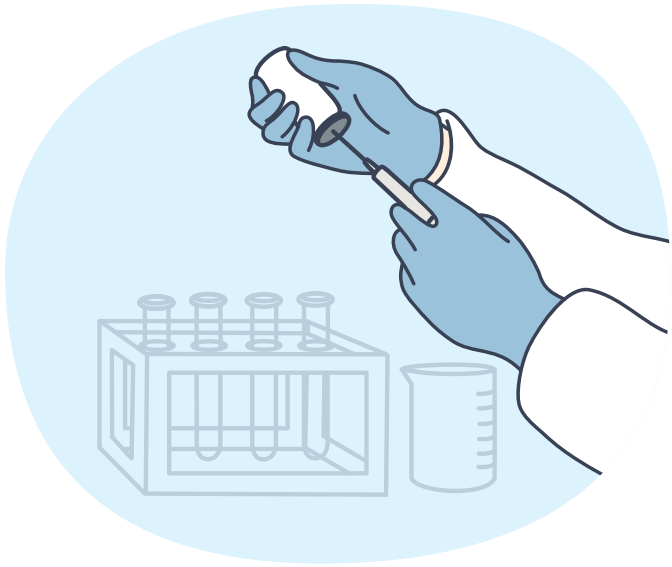

What you should know about the Pfizer-BioNTech COVID-19 vaccine

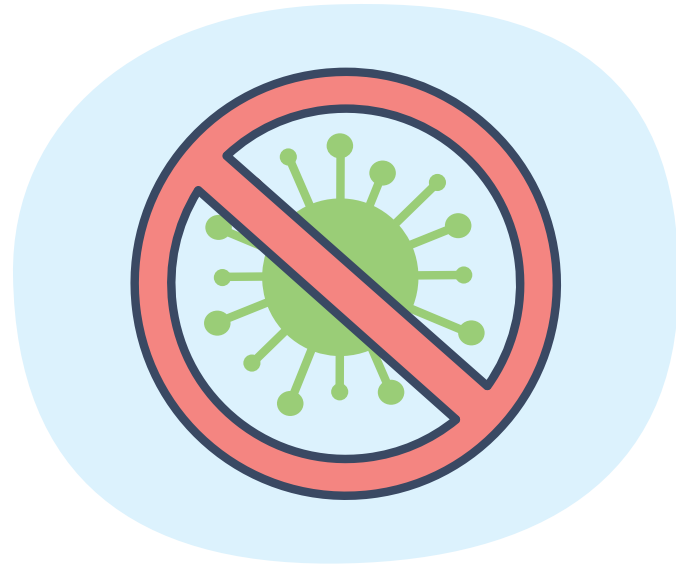

Vaccines are a safe and effective way to protect you from diseases.

The Pfizer-BioNTech COVID-19 vaccine is given in two doses.

The Pfizer-BioNTech COVID-19 vaccine was found to be 95% effective in trial participants.

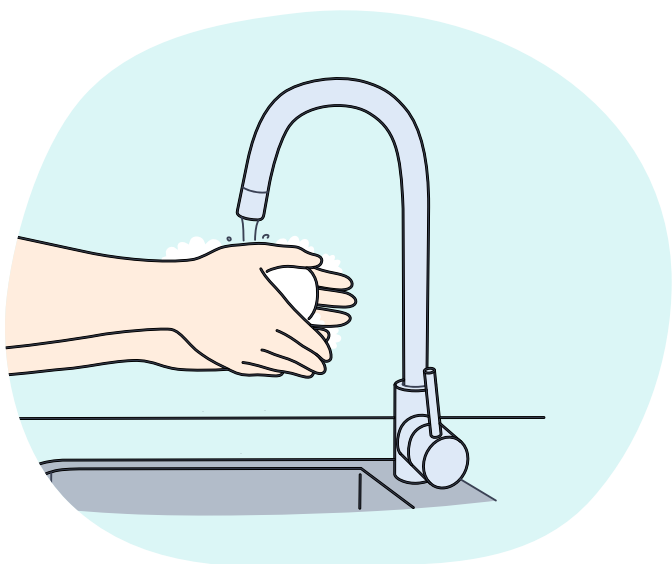

The COVID-19 vaccine won't give you the virus. It will help your body develop an immune response.

Tens of thousands of people received the vaccine during the clinical trial phase, reporting only minor side effects.

Some side effects may include: fatigue, headache, chills, muscle pain, fever and joint pain, which generally resolve after a day.

Getting the vaccine is your best shot at reducing the spread of COVID-19, but we need to keep wearing masks, physically distance and continue infection control measures to end this pandemic.

With every Sunnybrooker vaccinated, we're one step closer to beating COVID-19 and getting back to what we love.
